

One plan for the whole EV road trip.

Planning an EV road trip usually means keeping a route planner, charging apps, a food search and a navigation app in sync, then redoing it when the battery, a stop or the day changes. GYST puts those decisions in one iPhone trip plan: compatible charging with charging time, arrival battery and estimated cost, useful stops ahead on your route, and a battery estimate you can correct as the trip unfolds. Built by two Canadian EV owners.

WHAT IT DOES

Plans charging for your car. Compatible stops based on your car, starting battery, connectors and preferred networks, with driving time, charging time, arrival battery and estimated charging cost up front.

Plan a trip in your own words (Pro). Describe it, like "Toronto to Québec City on Saturday, lunch on the way." The AI drafts the trip; GYST's route planner calculates the route, battery and cost.

Finds stops ahead on your route. Food, coffee, bathrooms, groceries and parks, with the detour time and battery impact of each, so a place that looks close doesn't send you backward.

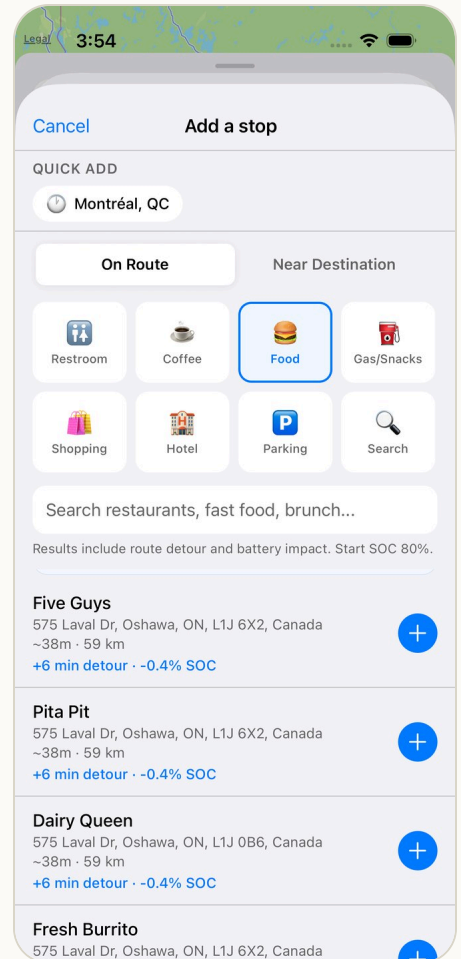

Keeps the plan useful on the road. Battery estimates update as you drive, and past drives refine future range estimates. At a charger, enter your real battery level to recheck the rest of the trip.

Plans multi-day trips. Choose how many hours you want to drive each day. GYST splits longer trips into daily legs and plans charging near overnight stops.

Also: saved and shared trips (Pro), work and personal drive history with CSV export, and Live Activities on the Lock Screen and in CarPlay.

GOOD TO KNOW

GYST plans the trip, then hands each leg to Apple Maps, Google Maps or Waze for turn-by-turn directions. On the road, trip info shows in CarPlay as a Live Activity, and a GYST CarPlay app focused on the charging plan is in the works. iPhone for now. Range, time, cost and charger status are estimates.

Food ahead on the route, with the detour time and battery impact of each (Oshawa, on the way to Montréal).
